PRODUCT USE CASES · VOLUME 2

Control what you owe, not just what you're owed.

Accounts payable automation and the full order-to-cash suite: *bills captured*, *approvals routed*, *payments timed*, and *every vendor obligation visible*, on the same platform that already runs your receivables.

86%
FASTER BILL PROCESSING

Invoicing, reminders, cash application

AP SUITE
Bill capture, approvals, payment scheduling

FULL SUITE
Both sides of the ledger, one platform

OVERVIEW

The problems we're solving

Every bill that arrives is a small decision: what it is, who approves it, and when to pay it. Multiply that by every vendor, every month, and it becomes one manual process, run by hand, that quietly costs time, cash, and control.

THE COST OF THE STATUS QUO

10-20d	$12-15	1-2%	Month-end
BILL-TO-PAYMENT CYCLE TIME	COST PER INVOICE PROCESSED MANUALLY	EARLY-PAY DISCOUNTS ROUTINELY MISSED	ONLY VISIBILITY INTO WHAT'S OWED

TODAY'S MANUAL BILL-TO-PAYMENT

Bill Arrives — email, mail, portal → **Keyed In** — by hand, days later → **Approval Chase** — email threads, delays → **Paid Ad Hoc** — too early or too late → **Cash surprise** — no control, no view

3-5 days of lag · no coding rules · no escalation · no target DPO

Every handoff adds days, dollars, and risk to money that's already going out the door.

01

Bills eat the day

Every bill is keyed in by hand: vendor, amount, GL code, due date. About 14 minutes each, and until it's entered, no one can see what's actually owed.

02

Approvals stall in inboxes

Sign-off chains live in email threads. A bill can sit for a week waiting on one manager, quietly running toward a late fee or a missed discount.

03

Payments happen ad hoc

Without a schedule, some bills get paid the day they arrive, giving up cash for no reason, while others slip past terms, risking fees and vendor trust.

04

Vendor spend is invisible

No live view of what's owed, to whom, or when. W-9s and 1099 status live in scattered folders until the year-end scramble.

THE METRIC THAT MATTERS

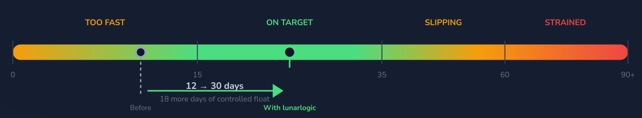
AP isn't about paying slower, it's about paying on purpose

It's called **Days Payable Outstanding (DPO)**: the average number of days between receiving a bill and paying it. Unlike DSO, the goal isn't the lowest number, it's a controlled, consistent one, matched to your actual terms.

$$\text{DPO} = \left(\textit{Accounts Payable} \div \textit{Total Purchases}\right) \times \text{Days}$$

Example: **$60,000** in unpaid bills ÷ **$60,000** purchased last month × 30 days = a **30-day** DPO, right on a standard net-30 term.

WHERE YOU STAND · THE SWEET SPOT



CASH RETAINED, NOT "FREED"

~$44K

Paying too early wastes float the same way slow collections waste it. For a business purchasing **$900K** a year from vendors, moving from paying in **12 days** to a controlled **30 days** keeps roughly **$44,000** in the business longer, every cycle (18 days × $900K ÷ 365).

HOW THE FOUR MODULES GIVE YOU DPO CONTROL

Bill Capture & Coding	ends entry lag, bills visible same day	same-day
Approval Workflows	ends the inbox bottleneck	6d → 1d
Payment Scheduling	hits a target DPO on every run	12d → 30d
Vendor Management	removes the visibility blind spot	real-time

Why this matters. Manual AP processing runs 10 to 20 days per bill and costs roughly $12 to $15 to process, industry-standard benchmarks that a controlled, automated process routinely beats by 75% or more. The savings aren't from delaying vendors; they're from finally having a process at all.

01 BILL CAPTURE & CODING

From vendor bill to coded entry, in minutes

A bill lands in your inbox. It leaves ready for approval, not a data-entry queue.

THE PROBLEM

Vendor bills arrive by email, mail, and vendor portals in every format imaginable. Someone re-keys the vendor, amount, GL code, and due date by hand, about 14 minutes per bill, and until that happens, the bill doesn't exist in your books at all.

THE SOLUTION

Forward or upload the bill. AI extracts the vendor, line items, amount, and due date, suggests the GL code based on vendor history, and creates a bill in QuickBooks or Xero ready for approval routing, no manual entry, no coding guesswork.

WORKFLOW

BILL IN

Bill Received — email, portal, or upload → **AI Extraction** — vendor · amount · due date → **GL Coding** — suggested from vendor history → **Bill Created** — ready for approval

≈ 2 minutes

Shown with QuickBooks. **Bills flow into QuickBooks, Xero, or your accounting system** the same way, from any vendor format.

86%	75%	Same day
TIME REDUCTION 14 MIN → 2 MIN	COST REDUCTION $12 → $3 / BILL	ENTRY LAG ELIMINATED

RESULTS

Bill processing time drops **86%**, and every bill posts to the books the day it arrives, with GL coding suggested automatically instead of guessed.

TANGIBLE BENEFITS

A firm processing **50 bills a month** saves about 12 minutes on each one, roughly **10 hours every month**, or 120 hours a year of staff time redirected from data entry to vendor relationships and cash planning.

Illustrative figures based on a typical firm profile and standard AP-automation benchmarks. Not a guaranteed result.

~10 hrs	~$4.2K
SAVED / MONTH	LABOR / YEAR*

02 APPROVAL WORKFLOWS

Sign-off that doesn't live in an inbox

Route by amount, vendor, or category. Escalate automatically. Never lose a bill in a thread again.

THE PROBLEM

Approval chains run through email and hallway conversations. A bill waiting on one manager's sign-off can sit for a week with no visibility, risking a late fee, a missed discount, or a vendor who starts asking questions.

THE SOLUTION

Configurable routing sends each bill to the right approver by amount, vendor, or GL category. Idle approvals get an automatic nudge, then escalate. Every approval is logged, with a one-tap mobile confirm, so nothing sits and nothing is undocumented.

ESCALATION TIMELINE

SUBMITTED	DAY 2	DAY 4	APPROVED
Bill routed to approver	**Reminder** if still idle	**Escalated** to next approver	**Scheduled** for payment

Every step logged for a full audit trail

83% FASTER APPROVALS 6 DAYS → 1 DAY

<1% LATE-PAYMENT RATE WAS ~8%

100% APPROVALS LOGGED

RESULTS

Approval cycle time drops from days to **hours**, late-payment incidents nearly disappear, and every sign-off carries a name, a timestamp, and a rule, exactly what auditors look for.

TANGIBLE BENEFITS

On **600 bills a year**, cutting late payments from roughly 8% to under 1% avoids an estimated **40+ late fees and rush charges annually**, plus the harder-to-price cost of vendors quietly tightening terms on a chronically late payer.

Illustrative figures based on a typical firm profile and standard AP-automation benchmarks. Not a guaranteed result.

~40 FEES AVOIDED / YR

~$1.4K DIRECT SAVINGS / YR*

03 PAYMENT SCHEDULING & OPTIMIZATION

Pay on your terms, every time

Every eligible discount captured. Every payment on schedule. No cash leaving before it has to.

THE PROBLEM

Without a schedule, payments happen by whoever has time that day. Some bills get paid the moment they arrive, giving up cash the business could have kept longer. Others slip past terms and trigger fees. Early-payment discounts sit unclaimed because no one is tracking which vendors offer them.

THE SOLUTION

A scheduling engine batches approved bills by due date, automatically flags and captures early-payment discounts when cash allows, and times ACH and check runs to hit a target DPO consistently, instead of paying early out of habit or late out of neglect.

ILLUSTRATIVE PAYMENT RUN

DUE DATE → Jun 12	Jun 18	Jun 24	Jun 30
Vendor A · $8,400 scheduled Jun 12	**Vendor B · $14,200** 2% discount captured paid within 10-day window	**Vendor C · $5,100** scheduled Jun 24	**Vendor D · $22,600** scheduled Jun 30

Target DPO: 28-32 days · this run averages 30 days

One batch, one schedule, cash timed to policy instead of habit.

18 days
MORE FLOAT
12D → 30D DPO

100%
ELIGIBLE DISCOUNTS CAPTURED

0
DUPLICATE PAYMENTS

RESULTS

Payments move from ad hoc to scheduled, hitting a controlled **30-day** target instead of an erratic 12-day average, while every qualifying early-payment discount is captured automatically.

TANGIBLE BENEFITS

For a business purchasing **$900,000** a year from vendors, moving from a 12-day to a controlled 30-day DPO keeps about **$44,000** in the business longer, every cycle. It doesn't arrive as a check, it's cash that simply stays in the account instead of leaving early.

04 VENDOR MANAGEMENT & AP DASHBOARD

Every vendor obligation, one screen

What you owe, to whom, and when, live, not at month-end.

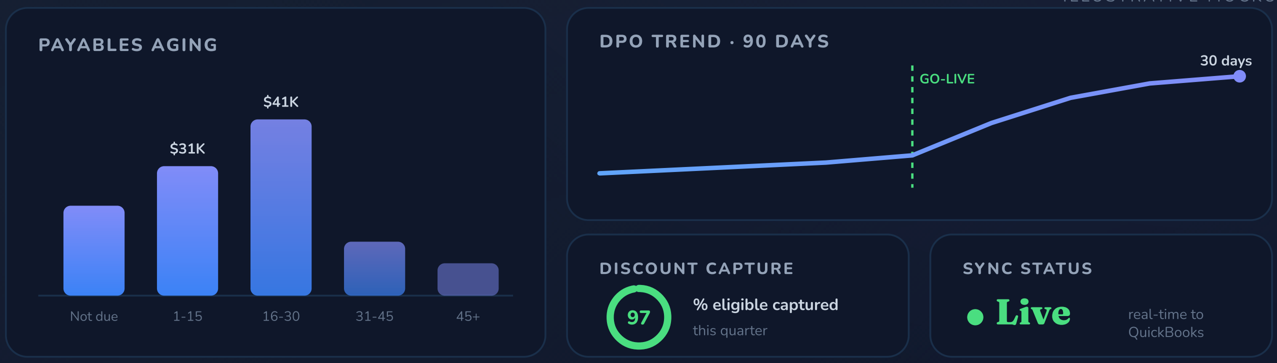
THE PROBLEM

Vendor records live across email, spreadsheets, and paper W-9s. There's no live view of what's owed by vendor, no upcoming payment calendar, and 1099 compliance becomes a scramble every January instead of a running total.

THE SOLUTION

A live dashboard synced from QuickBooks or Xero: payables aging by vendor, a DPO trend line, an upcoming payment calendar, and W-9/1099 status tracked continuously instead of reconstructed once a year.

ILLUSTRATIVE MOCKUP



Syncs live with QuickBooks, Xero, or your accounting platform, and delivers to Slack, Teams, or email, with no data migration required.

Live	**Hours**	**97%**
PAYABLES VISIBILITY	1099 PREP WAS DAYS	DISCOUNTS CAPTURED

RESULTS

Vendor obligations move from a month-end mystery to a live number, with W-9 and 1099 status tracked continuously instead of reconstructed in a January scramble.

TANGIBLE BENEFITS

Cutting 1099 season prep from about 3 days of manual reconciliation to a few hours frees roughly **20 hours a year**, and the bigger benefit is avoiding the per-form penalties and vendor friction that come from filing late or with bad data on file.

THE ACCOUNTING IMPACT

What AP automation does to your books

Speed and control are the visible benefits. The deeper return is what each module does to the reliability of the financial statements themselves, under U.S. GAAP: when expenses are recognized, how defensible the control environment is, and how much manual work it takes to trust the numbers at close.

Bill Capture & Coding

EXPENSE RECOGNITION

Under accrual accounting, an expense is recognized when incurred, not when paid. Capturing and coding a bill the day it arrives, instead of days later, keeps liabilities current and **reduces the manual AP accrual entries** accountants otherwise book at period-end to catch unrecorded bills.

Approval Workflows

INTERNAL CONTROLS

A documented, systematic approval chain with a named approver, a timestamp, and an escalation rule is exactly the **segregation-of-duties evidence** auditors and SOC 2 reviews look for, replacing an email trail that is difficult to reconstruct after the fact.

Payment Scheduling

AP AGING ACCURACY

Consistent, policy-driven payment timing keeps the **AP aging schedule accurate** and predictable, removing the manual reclass and correction entries that erratic early or late payments otherwise create, and supporting a cleaner cash-flow forecast.

Vendor Management

COMPLIANCE READINESS

Continuous W-9 collection and 1099 threshold tracking means **1099-NEC and 1099-MISC filings are compliance-ready year-round**, not reconstructed under deadline pressure, reducing the risk of late-filing penalties and incorrect vendor data.

The net effect across all four modules. A business running the full AP suite isn't just paying bills faster, it's producing accrual-accurate books, a documented control environment auditors trust, and compliance-ready vendor records, on the ledger you already keep, with a complete audit trail on every payment.

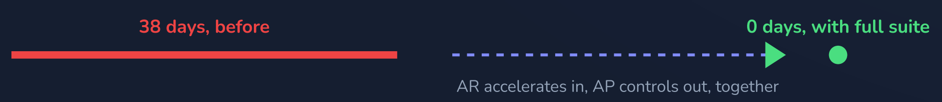
THE FULL SUITE

One platform, both sides of the ledger

AR and AP are usually run as two disconnected efforts: different spreadsheets, different owners, no shared view of cash. The full suite puts both on one platform, so accelerating what you're owed and controlling what you owe compound into a single number: how many days your cash is actually tied up.

THE CASH CONVERSION CYCLE, COMPRESSED

BEFORE	50-day DSO (slow collections) – 12-day DPO (paying too early) =	**38 days of cash tied up**
WITH LUNARLOGIC	30-day DSO (AR suite) – 30-day DPO (AP suite) =	**0 days of cash tied up**



38 → 0
DAYS OF CASH CONVERSION CYCLE

~$276K
COMBINED YEAR 1 VALUE, ILLUSTRATIVE

1
DASHBOARD FOR BOTH SIDES OF CASH

Not two tools, one system

Point solutions split the problem: AP-only platforms have no view of receivables, AR-only platforms have no view of payables. lunarlogic is done-for-you across both, on the accounting platform you already run.

The moat is depth, not features

As both suites mature together inside one system, the two sides reinforce each other: vendor payment history informs cash forecasting, customer collection patterns inform how aggressively you can extend your own terms.

One number to manage

Instead of a DSO conversation and a separate DPO conversation, ownership gets a single cash conversion cycle number, trending down, with the levers on both sides visible on one screen.

Illustrative figures for a representative $2.5M service firm: AR suite (~$137K working capital + ~$85K/yr recurring) plus AP suite (~$44K cash retained + ~$10K/yr recurring) on $900K in annual vendor purchases. Not a guaranteed result.

OUR MISSION

lunarlogic modernizes the accounting infrastructure of a business, module by module, across both receivables and payables, until the entire financial operating layer runs automatically: without manual intervention, and without a consultant.

40%	18 days	500+
AVG. DSO REDUCTION	AVG. DPO IMPROVEMENT	HOURS SAVED / YEAR / FIRM

THE MEASURABLE GAP · BEFORE VS. WITH LUNARLOGIC

METRIC	BEFORE	WITH LUNARLOGIC	IMPROVEMENT
Days Sales Outstanding	45-60 days	27-36 days	40%
Days Payable Outstanding	10-15 days (erratic)	28-32 days (on target)	+18d
Bill processing time	14 min / bill	2 min / bill	86%
Approval cycle time	6 days	1 day	83%
AP + AR admin hours	500+ hrs / year	Under 100 hrs / year	80%

Results First

Measured in hours saved and cash controlled, not features shipped. Quantifiable ROI within 30 days, or we keep working.

Deploy Fast

2-4 week deployment. Zero data migration, minimal disruption, results your team can see immediately.

Built for Humans

Automation eliminates the tedious work; your team keeps the judgment, the vendor relationships, and the decisions.

Start with your own numbers.

Your DSO today: **AR balance ÷ last 30 days of revenue × 30**. Your DPO today: **AP balance ÷ last 30 days of purchases × 30**. The gap between them is cash you can recover.
